

FIND OUT THE TRUE AGE OF YOUR BLOOD VESSELS

Half of the premature deaths in developed countries are due to cardiovascular disease. More than half of patients with acute myocardial infarction had previously only minimal changes in heart arteries! Cardiovascular diseases have been developing for years and therefore we can influence their development.

ARTERIOGRAPH

is a device for measuring the functions of the vascular system and estimating the age of your blood vessels. Can clarify the answer to **your personal cardiovascular risk**.

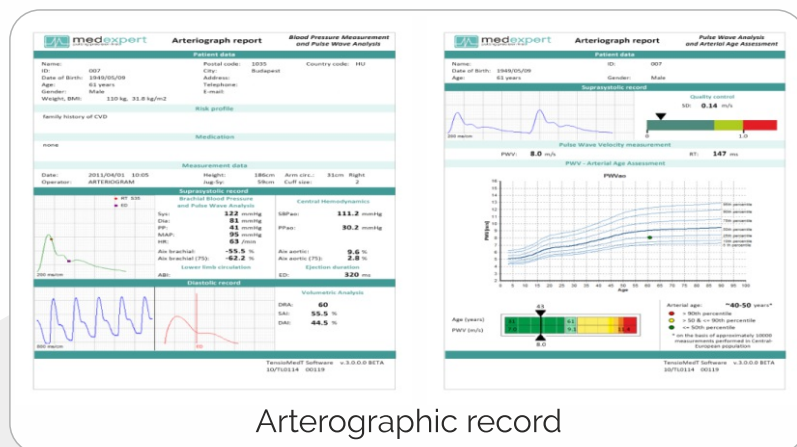

The arteriographic examination is evaluated by a doctor with more than 20 years of experience in the treatment and prevention of cardiovascular diseases. The result is understandable to your GP and is intended to help you and your doctor influence the threat of a heart attack.

The age of your blood vessels is just as important but a much more interesting figure than your cholesterol level.

An examination by an arteriographer may be recommended to anyone over the age of 20, but in particular:

- > those who live and work in excessive stress,
- > those who are overweight,
- > smokers
- > diabetics,
- > patients with kidney diseases,
- > patients with high blood pressure people who have already had hypertension, heart disease or diabetes,
- > patients with high cholesterol or triglycerides
- > patients with any symptoms suggestive of arterial disease,
- > women in climacterium.

Let's
measure
the
function
and age
of your
blood
vessels
to slow
down
time and
aging!

ORDER FOR EXAMINATION
ŠUMPERSKÁ ULICA Č. 44,

971 01 PRIEVIDZA
